

CAAD^{EX}

SOLUTIONS OF HONEY

CAAD^{EX} honey storage, honey tapping containers, guillotine taps and cleaning instructions for tilting stands:

The raw material of the CAAD^{EX} honey storage, honey tapping containers and guillotine tap products are CAAD^{EX} stainless steel, and the tilting lifting platforms of these products are made of aluminum alloy.

The products generally contact with several types of honey products in a different length of time.

We recommend to use warm water to clean our empty containers. To cleaning by clean water, the use of non-abrasive dishwashing detergent is allowed during the cleaning process process, after which it is recommended to thoroughly rinse with clean water and wipe dry with a soft cloth.

The following should be avoided when cleaning the above-mentioned products:

- Use of hot water (material may cause discolouration)
- Use of strongly alkaline or acidic cleaning chemicals. (could cause a corrosive effect on the surface of the raw material)
- The use of abrasive products based on carbon steel is prohibited. (These products over-contaminate the stainless material and cause surface oxidation)
- The use of abrasive sponges and materials with a rough surface is prohibited. (They could cause micro-damages, due to which stainless steel containers may show surface oxidation in the long term.)

Please follow the cleaning instructions so that our products can be used in your apiary for a long time.
